## LIVING SOIL SOLVENTLESS

We believe that the pathway to a better world starts with living soil agriculture, sustainable packaging, and hashish.

Our ingredients are simple: water, ice, and cannabis.

## LIVING SOIL SOLVENTLESS

Q: What is **Living Soil Solventless**?

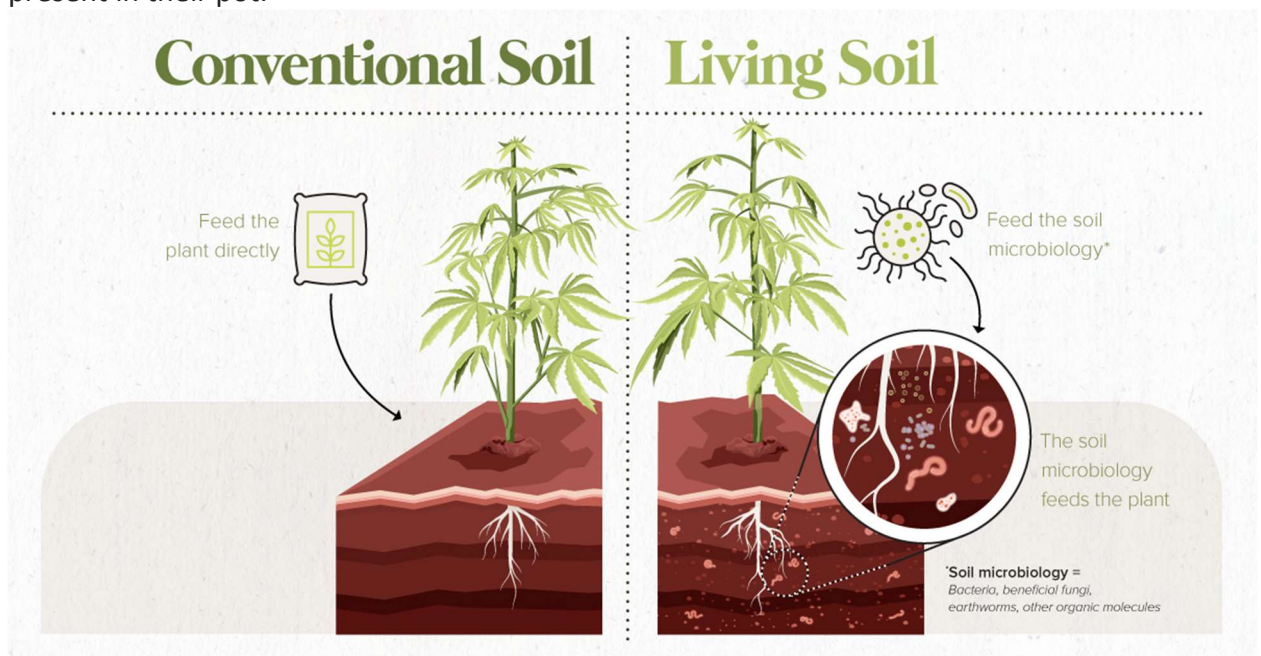

A: We are a solventless company because we believe in making the **cleanest** products possible. **No additives** or chemicals are used in our hash-making process, and it all starts with the **soil**.

### Living Soil - Small Craft Farms

- **Natural** - “**Feed the soil, not the plant**” Supports microbial life in the ground and lets the plants uptake nutrients as they need them.
- **Sustainable** - Build the soil up and watch it get better year after year.
- **Healthy Plants** - Plants grown in living soil are hardy and resilient to pests and disease, eliminating a reason to use harmful chemicals such as pesticides.

### Conventional Dirt- Industrial Farms

- **Wasteful** - Throw your soil away at the end of each season and buy more.
- **Unnatural** - Funnel feeding your plants bottled nutrients to pump them up and increase yields. Higher yields do not always equal higher quality.
- **Sickly** - Plants growing in dead soil are more susceptible to pests and disease; this is why most industrial grows commonly have detectable amounts of numerous pesticides present in their pot.

## **Our Mission:**

We believe in a world where cannabis consumers always have a clear and accessible chemical-free option. We do this by crafting boutique, additive-free concentrates from sustainable, biodynamic, and regenerative cultivators for the masses. In addition, we provide a clean alternative for those who conscientiously avoid additives in food and are conflicted with consuming them in cannabis.

At Hella Dank, we are one hundred percent solventless. We utilize techniques and methodology which employ absolute minimal processing with zero chemical adulteration. We also source from living soil sun-grown cultivators, keeping our carbon footprint small and our love for nature big.

## **What is Ice Water Hashish (hash)?**

Ice water hashish is simply the resinous trichome heads separated from the remaining plant. Just above freezing temperature, ice water, and minimal agitation alone will cause trichome heads to break, freeing the trichome stems. The cannabis-infused ice water is sieved with different sized micron screen bags, resulting in a thorough separation of trichome heads from stems and the remaining plant matter.

## **A Brief History of Hashish:**

Hashish has been consumed in many cultures worldwide and is always highly regarded for medicinal properties – both spiritual and physical. It can be used in various ways: non-addictive edible painkillers, topical relief for joint pain, and smokable for poor digestion, insomnia, anxiety, etc.

This solventless cannabis concentration is a representation of the plant's true essence. In regions where traditional culture still embodies the land and its people, no waste is created by biological material. Thus, historically prevalent, hashish is distinguished by region and the processes used. The best example is the Nepalese Royal Temple Ball, world-renowned for its potency, fragrance, and flavor.

With modern technology, the hashish industry can soar to heights never imagined. Freeze dryer technology allows us to perfectly dial in the degree to which the hashish is dried; this is important because the flavor of hashish is negatively impacted when under or overdried. We are also able to preserve the original color of the trichomes and the flavors of the terpenes.

## Hashish Grades:

- < 3 Star (and less): Sizzle grade, made into other products.
- **4 Star:** **Bubble** grade, suitable to smoke on its own, fully formed bubbles represent active resin.
  - **Pressed & Sieved:** Our version of unpressed hash. It has been pressed to achieve full potential, then unpressed for convenience
  - **Pressed Slabs:** Modern Moroccan slate hash/Old school pressed hash
- **5 Star:** **Liquifies** and actively bubbles, excellent melty hashish.

4 Star Pressed & Sieved

4 Star Pressed Slab

5 Star Hashish

\*Free ceramic screen included with all 4 star\*

## What is Hashish Rosin?

- **100% Solventless Dabs** (hash oil) made from ice water hashish
- **No chemicals** to purge
- The olive oil of hashish is squeezed out using light heat and pressure
- Can be smoked with a nectar collector, PuffCo, dab pipe/bong/pen, on top of flower, in a joint, hot knives, etc.

5 Star Hashish Rosin

## Hash Infused Pre-Rolls

- 80% Living Soil Flower + 20% Living Soil Hashish
- Singles Packaged in **100% Reclaimed Ocean Plastic Tubes**
- Singles: 0.8g total  
4Packs: 2.0g total (4x 0.5g joints)
- 20% hash overall, 30% concentration in the section you smoke. For a smoother burn and overall hashier flavor, we don't put in any hash in the roach portion of the joint.
- Hash Bomb (Red Tube): 35% hash overall, 42% concentration in the part you smoke.

## How we fit into the industry:

We're bringing the best aspects of the evolving food industry to cannabis. Food production in America took a noticeable turn for the better about ten years ago. Non-GMO and Organic Foods are on the rise, and chemical-ridden food companies struggle to justify promoting their unhealthy products.

As this change happened by voter initiative (when your dollar counts as a vote) in the food industry, it became apparent that there will be a demand for this trend in the cannabis industry. Regulations make solventless manufacturing seem tedious and less appealing in yield in comparison to solvent extraction methods. "Hella Dank" happily embraces these difficulties because we are committed to sharing the benefits of solventless cannabis.

## Differentiation:

We will **only** ever produce **living soil solventless** products.

Concentrates are grouped as one big category, and many consumers have a hard time navigating the differences. Unfortunately, most concentrates attempt at isolating THC from the rest of the plant, whereas solventless achieve something completely different. Solventless highlights all the subtleties naturally found in cannabis because that is what it is: cannabis in its purest form. Many terpenes and vital components of the cannabis plant are lost in this process of solvent-based extractions. Just as it would be improper to put wine and vodka in the same category, it's not right to group hash and hydrocarbon extracts together.

There are only a few solventless manufacturers in California, and most of them focus on producing powdered hash, not bringing the hashish to its fullest potential. Hashish is not fully activated until it is properly pressed. "Hella Dank" doesn't take any shortcuts. We press and hand-roll our temple balls with precision and care.
